

Science Unit 3 Reivew

Cell- smallest part of any living organism that can do all things needed for life

Mitosis- one cell dividing into two identical cells

Tissue- group of cells that do a certain job

Bones- organs that support the body, store minerals, and allow movement

Kidneys- organ that removes waste from the blood, controls the blood's salt level, and helps conserve water

Circulatory system- organ system that delivers food to cells

Cell wall- helps plants keep their shape

Plant Cells- have all same parts as animal except plant also has cell wall and chloroplasts

Nerve Cells- shaped like threads

Chloroplast- use energy from the sun to make food for plant

Muscular System- allows your body to move

Circulatory and respiratory Systems- work together by respiratory taking in oxygen and circulatory transporting it to cells

Bladder- where urine is stored

Stomach- acidic juices mix with food there.

Pituitary Gland- produces a growth hormone that makes you taller

To cool your body we sweat- the evaporation of water removes heat from the body
